## **SAINT FRANCIS HOSPITAL AND MEDICAL CENTER NAMED A 2016 “MOST WIRED” HOSPITAL**

*Most Wired Hospitals Use Technology for a Better Patient Experience*

**CHICAGO, July 7, 2016**—Technology is improving the efficiency of care delivery and creating a new dynamic in patient interactions, according to results of the 18<sup>th</sup> Annual Health Care’s Most Wired® survey, released today by the American Hospital Association’s (AHA) Health Forum.

Named to the *Most Wired* list for the 7<sup>th</sup> consecutive year, Saint Francis Hospital and Medical Center is one of nine hospitals in Connecticut to be recognized this year for using information technology for a better patient experience.

According to the survey, Most Wired hospitals are using telehealth to fill gaps in care; provide services 24 hours a day, 7 days a week; and expand access to medical specialists. This year’s results show:

- The top three telehealth services offered in hospitals are consultations and office visits, stroke care, and psychiatric examinations and psychotherapy.
- Stroke care is the most rapid growth area for telehealth services up 38 percent from 2015, as evidence-based studies emphasize the time urgency of stroke care.
- More than 25 percent of hospitals use internet-enabled monitoring devices for chronic disease management of congestive heart failure, diabetes and heart disease.

“Our use of innovative technologies across all hospital platforms ensures that our patients have the very best hospital experience,” said John F. Rodis, M.D., M.B.A., president, Saint Francis Hospital and Medical Center. “Connecting our caregivers and patients through technology will lead to improvements in the overall health of our communities. We are most pleased to once again be the recipient of the *Most Wired* recognition.”

“Information technology has allowed us to make great strides in changing patient outcomes and improving safety and quality,” said Linda Shanley, vice president, chief information officer at Saint Francis. “Health IT is allowing organizations, such as ours, to aggregate large amounts of data in ways that were not possible 15 years ago. We can look at patient populations on a macro level more effectively across the continuum of care.”

In redefining the way that they provide care in their communities, Most Wired hospitals are using technology to build patient engagement with the individual’s lifestyle in mind, which includes electronic access to their care team.

- 68 percent accept patient-generated data through the patient portal.
- 26 percent of Most Wired organizations offer E-visits through a mobile application.
- 61 percent use social media to provide support groups.

“Hospitals are breaking-out of their traditional four walls and providing care where and when patients need it,” said Rick Pollack, president and CEO of the AHA. “These Most Wired hospitals exemplify this transformation by harnessing technology, engaging patients and offering services remotely. And, removing policy and other barriers to telehealth will allow even faster adoption of these amazing technologies.”

Most Wired hospitals are utilizing population health management tools and partnering with other health care providers to share critical clinical information used in analyzing interventions aimed at key patient groups, such as those with diabetes. To get patients the right care, hospitals are using

predictive modeling to eliminate preventable problems.

- 53 percent interface electronic health record data with population health tools.
- 62 percent stratify patients according to risk.
- 51 percent aggregate data from patient encounters to create a community health record.

The versatility of mobile technologies makes it possible for clinicians and care team members to have the right tools for sound clinical decision-making wherever they are: 81 percent of Most Wired hospitals use mobile applications to notify clinicians of sudden changes in patient conditions and correlated events such as falls or respiratory distress or failure.

As they build out new capabilities, hospitals are also taking strong actions to ensure health data is secure.

- More than 90 percent use intrusion detection systems, privacy audit systems and security incident event management to detect patient privacy breaches, monitor for malicious activities and produce real-time analysis of security alerts.
- 84 percent conduct a third-party security audit annually to ensure that guidelines are followed.

HealthCare's Most Wired® survey, conducted between Jan. 15 and March 15, 2016, is published annually by *Health & Hospitals Networks (H&HN)*. The 2016 Most Wired® survey and benchmarking study is a leading industry barometer measuring information technology (IT) use and adoption among hospitals nationwide. The survey of 680 participants, representing an estimated 2,146 hospitals—more than 34 percent of all hospitals in the U.S.—examines how organizations are leveraging IT to improve performance for value-based health care in the areas of infrastructure, business and administrative management; quality and safety; and clinical integration.

Detailed results of the survey and study can be found in the July issue of H&HN. For a full list of winners, visit
